COVID-19 Cases and Deaths

- As of 09 December 2023 (5PM, GMT+7), there were **699,231,095** confirmed cases **worldwide**, including **6,954,090 deaths**. Globally, Case Fatality Rate (CFR) was **0.99%**.
- 36,527,682 total confirmed cases** of COVID-19 have been reported in the **ASEAN Region**.
- The CFR in the **ASEAN Region** was **1.01%**.

Event Updates for Emerging Diseases

Epidemiological Week 49 | December 3 – December 9, 2023

Global Updates for Emerging Diseases

COVID-19

- **India** has recorded 83 new COVID-19 infections, 512 active cases, and 533,301 deaths (PTI, 2023). The country's COVID-19 case tally is 45 million, with a recovery rate of 98.81% and a CFR of 1.19%. 2.2 billion COVID-19 vaccine doses have been administered. [[Full article](#)]

Regional Updates for Emerging Diseases

COVID-19

- **Indonesia:** The Indonesian Ministry of Health (MOH) has urged increased vigilance amid a rise in new COVID-19 subvariants, including EG.5 and EG.2, which have become the dominant Omicron subvariants in the country (The Jakarta Post, 2023). The number of novel coronavirus infections has risen from 10 to 20 weekly cases to 276 cases last week. [[Full article](#)]

Indonesia has experienced an increase in COVID-19 cases, triggered by the Eris EG.5 and EG.2 variants, which spread in Singapore (Pinandhita, 2023). The Indonesian Medical Association (IMA) COVID-19 Task Force and pulmonologist stated that COVID-19 cases in Indonesia doubled during October to November this year, while the Indonesian MOH reported an 80% increase from 28 November to 2 December 2023. A team member from IMA Task Force explained that the decline in immunity from the COVID-19 vaccine is a significant factor, as the level of protection from the vaccine decreases within six to 12 months. Vulnerable groups, such as the elderly and those with comorbidities, should receive booster injections to reduce the risk of serious symptoms. [[Full article](#)]

- **Malaysia:** Sarawak Tourism, Creative Industry and Performing Arts Minister has expressed confidence in the MOH's ability to handle the surge in Covid-19 cases in Malaysia (Tawie, 2023). He stated that everything is currently under control and that the rate of fatalities is less than 10%. However, he advised the elderly to take extra precautions due to their vulnerability. The MOH reported 3,626 Covid-19 cases from November 19 to 25, with 48.3% of cases involving those aged 20-40. [[Full article](#)]
- **Thailand:** A renowned pulmonologist, has warned of the escalating COVID-19 crisis, revealing that in November alone, 545 cases were reported. The report highlights the grim tapestry of afflictions, including COVID-19, Influenza, Human Metapneumovirus (hMPV), Respiratory Syncytial Virus (RSV), dengue Fever, chikungunya, and norovirus (Tantivangphaisal, 2023). The alarming rise in COVID-19 cases surpasses even the flu, highlighting the dire state of respiratory health. [[Full article](#)]
- The **Philippines** recorded 1,340 new coronavirus cases from November 28 to December 4, 2023, the highest number in 19 weeks, according to the Department of Health (Locus, 2023). The recent week saw a 10% increase from the previous week's 1,218 cases. This marks the fourth consecutive week of increasing cases and over 1,000 new weekly cases. The average daily case rate increased by 10% to 191, marking the 19th consecutive week of more than 100 but less than 200 new cases. [[Full article](#)]

- The **ASEAN** region reported **484** rabies cases, **484** confirmed rabies cases, with **100%** CFR.

Event Updates for Zoonosis

Epidemiological Week 49 | December 3 – December 9, 2023

Global Updates for Zoonosis

Highly Pathogenic Avian Influenza H5N1

- **France** has ordered a third dose of a bird flu vaccine to be given to ducks in areas most at risk, citing new scientific evidence to avoid a surge in outbreaks (Hamaide, 2023). The risk level of bird flu was raised to 'high' from 'moderate' after new cases were detected, forcing poultry farms to keep birds indoors. The three-dose protocol will be applied from first week of December until March 15, 2024, targeting mulard ducks, which are used for foie gras. The decision was taken after post-vaccination monitoring showed a high potential for transmission of the bird flu virus and a reduction in duck immunity at 11 weeks of life. [\[Full article\]](#)
- **Germany:** A highly pathogenic H5N1 bird flu outbreak has led to the slaughter of 6,700 ducks and geese on a farm in east Germany (Hogan, 2023). The disease, which typically strikes in Europe during autumn and winter, has been detected on farms in France, the Netherlands, and Belgium, forcing poultry farms to keep birds indoors. [\[Full article\]](#)
- **Japan:** A highly pathogenic avian influenza virus of the H5 subtype has been detected in a buzzard in central Tokyo, marking the first instance of infection in a wild bird during the current avian flu season (Xinhua, 2023). The buzzard's body was found in Chiyoda Ward, and genetic testing confirmed its infection. Over 40 cases of wild bird infections have been reported across Japan. [\[Full article\]](#)
- **Republic of Korea** has confirmed two more highly pathogenic avian influenza cases at chicken farms, bringing the total number of cases to six this winter season (Seok-min, 2023). Health authorities cordoned off farms and implemented quarantine measures, including culling chickens. The government has increased measures to curb the infection and detect cases early, including more frequent AI tests and in-depth inspections of 430 duck farms. The finance and agriculture ministries have pledged to enhance market price monitoring of eggs and chicken. [\[Full article\]](#)

Leptospirosis

- **Ukraine:** A 73-year-old pensioner in the Lviv region died from leptospirosis, likely due to contact with rodents. The illness began with increased body temperature, headache, vomiting, severe pain in the calf and other muscles, jaundice, and decreased urine (Високий Замок, 2023). Leptospirosis is a dangerous zoonotic infectious disease caused by the bacterium *Leptospira*, and late seeking medical help can lead to severe complications. This is the second leptospirosis case in the Lviv region this year. [\[Full article\]](#)

Rabies

- **India:** A 50-year-old woman, died during treatment in Bareilly after being attacked by a jackal 20 days ago. The attack occurred while gathering fodder for cattle in a nearby forest (Punjab News, 2023). Condition deteriorated due to a rabies infection, and she died during treatment. The forest department is investigating the incident, and if a jackal was killed by the villagers, an FIR may be required under the Wildlife Protection Act. [\[Full article\]](#)

A 58-year-old schoolteacher and his son died of rabies after their pet cat in Kanpur contracted the virus from a stray dog (Times Now, 2023). The family ignored the condition, but the 24-year-old's condition worsened after being scratched by the cat.

The father also died. The family continued with general treatment and took anti-tetanus injections, despite the cat's death. The family took the situation lightly, and blood samples of all family members were sent for testing to prevent further infection spread. The incident highlights the importance of recognizing and preventing rabies. [\[Full article\]](#)

- **South Africa:** A human rabies case in the Eastern Cape has increased the number of human rabies cases in South Africa to 10 (Ngema, 2023). The case involved a 10-year-old girl from Buffalo City Metro Municipality. The NICD confirmed the diagnosis through fluorescent antibody testing on a post-mortem brain sample. Rabies can be controlled and prevented through various approaches, including vaccinations under the Animal Diseases Act. Educating the public on dog behavior and preventing bite exposures is also crucial. Victims should seek medical care for rabies post-exposure prophylaxis (PEP). [\[Full article\]](#)

Regional Updates for Zoonosis

Rabies

- **Indonesia:** In 2023, South Sulawesi experienced a significant increase in rabies cases, with 11 people dying (Lallo, 2023). The Disease Prevention and Control Division of the South Sulawesi Health Office reported 8,072 cases, with 11 of them fatal. The cases were reported in 24 regencies and cities across the country. The head of the Disease Prevention and Control Division, stated that rabies cases can be immediately acted upon and hopes for fewer cases in the coming year. The Head of the South Sulawesi Health Office, urged the public to be aware of rabies-transmitting animals, both pets and wild ones, and to take immediate action if they experience bites or scratches from infected animals. Event Updates for Vector-borne Diseases

Epidemiological Week 49 | December 3 – December 9, 2023

Global Updates for Vector-borne Diseases

Dengue

- Bangladesh** has recorded 1,652 dengue deaths from January 1 to December 9, the highest in a year since 2000 (Bss, 2023). The death toll has risen to 316,773, with 2,281 deaths in 2000. The number of patients has increased to 316,773, with 3,12,709 released from different hospitals this year. The highest death toll since 2000 is recorded in Dhaka city. [\[Full article\]](#)
- India:** The district collector has reviewed dengue control measures and reported 62 cases in the last three weeks, with 40 from Khammam district and 22 from other areas (Telangana Today, 2023). Since January 1, 2023, there have been 505 dengue-positive cases in Khammam district. Since January 1, 27,771 tests have been conducted, with 120 in urban and 385 in rural areas. The collector has directed health officials to increase tests and take effective measures to control dengue. Test kits and medicines are available, and officials should participate in dry day activities every Friday. [\[Full article\]](#)
- Italy** has seen 347 dengue cases since January 1, with indigenous cases remaining constant at 82 (Redazione, 2023). Imported cases have slightly increased, with Lombardy leading with 111 cases. Imported cases from Mexico, Thailand, India, and Cuba account for 12% of cases. Only one death has been recorded since January 1, 2023. [\[Full article\]](#)
- Pakistan:** The dengue virus remains active in Punjab, with 14,721 confirmed cases this year. Lahore leads the list with 6,756 cases, followed by Rawalpindi with 2,648, Gujranwala with 1,559, Multan with 1,413 and Faisalabad with 878 (Desk, 2023). The situation continues, with Lahore reporting 37 new cases, Rawalpindi with five, Gujranwala with four, Multan nine, Faisalabad seven, Sheikhupura and Kasur with two new cases each. 55 patients are currently undergoing treatment in hospitals across Punjab. Punjab Health Secretary urges citizens to maintain clean and dry surroundings and cooperate with Health Department teams. [\[Full article\]](#)
- Republic of China:** Taipei City has reported a new local case of dengue fever, diagnosed between November 28 and December 5. The case, aged 50, was diagnosed after a history of activity in Kaohsiung (Wanqian, 2023). As of December 5, Beijing City has 96 confirmed cases, including 44 imported cases and 52 local cases. The North City Health Bureau urges citizens to strengthen environmental inspections, remove stagnant water, reduce container size, and implement "inspection, dumping, cleaning, and brushing" due to the recent drop in temperature and occasional rainfall. Anti-mosquito measures include wearing light-colored clothes and applying repellents. [\[Full article\]](#)
- Sri Lanka:** Dengue cases in Sri Lanka have surged in the Western, Southern, Sabaragamuwa, and North Central provinces, with Kandy District experiencing a gradual increase (First, 2023). A "Dengue prevention month" was declared for Kandy from November 22 to December 22. [\[Full article\]](#)
- The **United Kingdom (UK)** health experts predict that climate change could bring Asian tiger mosquitoes carrying dengue fever to England by the middle of this century. (Ebrahimi, 2023). The insect, which carries diseases like dengue fever, zika virus, and chikungunya, has already spread across Europe due to warmer conditions. The UK Health Security Agency (UKHSA) warns that dengue fever could be transmitted in London by 2060 and the mosquito could become widely established across England in

the 2040s. Other infectious diseases spread through food or water could become more prevalent, with the risk of more pandemics increasing. Extreme heat and flooding will worsen, and vulnerable populations, such as the elderly, young children, and those with pre-existing health conditions, are most vulnerable. The UKHSA suggests adaptation, reduction in emissions, and improvements to housing, flood defenses, and extreme temperature warnings to mitigate these growing dangers. [\[Full article\]](#)

- **Guam:** A new case of dengue fever has been confirmed in Guam, marking the second confirmed case this year (Degaldo, 2023). The case was confirmed through a blood test and local health officials determined it was likely an imported case. The Department of Public Health and Social Services Division of Environmental Health is canvassing homes and conducting weekly mosquito surveillance in vulnerable areas and ports of entry. Event Updates for Vaccine-Preventable Diseases

Epidemiological Week 49 | December 3 – December 9, 2023

Global Updates for Vaccine-Preventable Diseases

Measles

- **Kazakhstan:** The measles situation in Astana remains unstable, with over 731 confirmed cases, with 73% of cases being children under 14. Most cases are under 4 years old, with 100 cases being infants under 12 months old (Kazinform, 2023). 93% of infected children and teens are unvaccinated. The chief state sanitary doctor emphasizes vaccination as the only way to prevent measles spread and complications. As of December 6, 16,477 people were vaccinated. [\[Full article\]](#)

In Kostanay, over 20 measles cases were recorded in December, up from 32 in November. The number has risen to 145, with 56.5% of cases in unvaccinated individuals and 64.1% in children under 14. [\[Full article\]](#)

- **Russia:** Beloretsk has reported 21 measles cases, mostly among children under 18. The first case was a teenager from a large family who fell ill due to their parents' beliefs (Aif, 2023). The children are being treated in the infectious diseases department of the Beloretsk Central District Clinical Hospital. Distance learning has been transferred to schools where sick children study, and disinfection has been carried out at children's music schools. Kindergartens are operating normally, but anti-epidemic measures have been strengthened. [\[Full article\]](#)

Pertussis

- **United Kingdom:** COVID-19 has caused a 250% surge in whooping cough cases in England and Wales, according to the UKHSA. The highly contagious disease, which is highly contagious, can cause serious illness, especially in infants and children (Zhaoxi, 2023). The disease is not lifelong immunity, so older children and adults can also become infected. Infants under 6 months of age are particularly vulnerable to complications such as dehydration, persistent breathing problems, pneumonia, and seizures. The age of pertussis cases is unknown. Treatment depends on the individual's age and infection history. [\[Full article\]](#)
- **United States:** Fargo Cass Public Health emphasizes the importance of getting vaccinated for pertussis as cases continue to rise in Cass County (Redmond, 2023). Pertussis, also known as whooping cough, is highly contagious and can be spread through coughing or sneezing while in close contact with others. Infants under one year of age are at the highest risk of developing severe breathing problems and life-threatening illness from whooping cough. The best form of protection is vaccination for everyone eligible, including infants, children, caregivers, pregnant people, and the elderly. Antibiotics may be recommended for those who came into contact with an active case, and adults or children with trouble breathing should seek medical attention immediately. [\[Full article\]](#)
- **Russia:** The Altai Republic recorded 12 cases of whooping cough from November 25 to December 1, with 92 identified in ten months, primarily in Gorno-Altai. schoolchildren are most susceptible, with 87.5% immunity coverage (Republic, 2023). [\[Full article\]](#)

Typhoid

- **India:** In Munger, typhoid cases have risen significantly, with 38 patients visiting Melancholyar Hospital within two months after dengue (Irshad, 2023). [\[Full article\]](#)
- **Sweden:** Seven students at the Waldorf School in Hardeberga, Sweden, have contracted typhoid fever, a rare bacterial disease that can lead to sepsis (Muhsin, 2023). The outbreak was discovered a month ago after parents reported high fevers. The disease is spread through contaminated water or improperly cooked food, and careless hand hygiene. The spread is attributed to a friend sharing a clementine with his classmates. [\[Full article\]](#)

Event Updates for Other Infectious Diseases

Epidemiological Week 49 | November 26 – December 9, 2023

Regional Updates for Other Infectious Diseases

Mycoplasma pneumoniae

- **Indonesia:** The Indonesian MOH has reported a resurgence of mycoplasma cases in DKI Jakarta, with six patients has been recovered (Sagita, 2023). The government is conducting epidemiological investigations to determine the possibility of widespread spread, particularly in schools. A pediatrician from Cipto Mangunkusumo Hospital suggests that mycoplasma is transmitted through droplets and saliva, potentially affecting children at schools, playgrounds, and family gatherings. He urges parents to pay attention to sick children and promote clean and healthy living habits. [[Full article](#)]
